Amendments to the Claims:

This following listing of claims will replace all prior versions, and listings of claims in the application.

Listing of Claims:

1. (Currently Amended) A method for determining a scent or taste profile of a user eonsisting in comprising:

storing for each of a set of products chosen among products for which a database (1) contains includes smell of or taste prints constituted by a set of measurements given by smell or taste electronic sensors, a satisfaction note rating (SN) given by the user; and

automatically calculating weighting coefficients constituting said profile and respectively affected to said sensors measurements, by successive approximation of sets of weighting coefficients leading to minimizing the sum of the quadratic errors over the set of satisfaction notes.

2. (Currently Amended) The method of claim 1, in which the weighting coefficient of the user's profile are determined by minimizing the result of the following formula by successive approximation of sets of weighting coefficients α_j :

$$\sum_{h=1}^{q} \left(SP_h - \sum_{j=1}^{n} (\alpha_j \cdot MV_{j,h}) \right)^2,$$

where SP_h designates the rating given by the user for the product of rank h of said set of q products, where α_j designates the weighting coefficient of rank j affected to the product of rank j of the smell or taste prints, and where $MV_{j,h}$ designates the scores of rank j of the smell print of perfume product of rank h.

Application No. 10/615,157
Preliminary Amendment mailed February 4, 2005

- 3. (Currently Amended) The method of claim 1, in which wherein each satisfaction note rating is a value range from 1 to 5, and preferably from 1 to 3.
- 4. (Currently Amended) The method of claim 1, eonsisting in <u>further comprising</u> asking <u>receiving from</u> the user <u>for giving</u> an additional rating for an additional product selected, on the basis of the already given ratings, as being the product for which the notation of the user will be the most relevant for the user profile.
- 5. (Currently Amended) The method of claim 4, in which wherein the selection of the additional product is made by maximizing the following formula over all the products:

$$\sum_{j=1}^{m} \left(\sum_{L=1}^{NL} \frac{f(L) \cdot \left| \alpha_{j,s} - \alpha_{j,s',L} \right|}{\alpha_{j,s}} \right),$$

where NL is the total number of values for the ratings L of the user; $\alpha_{j,s}$ is the set of coefficients α_j already calculated on the basis of the q perfumes products already noted by the user; $\alpha_{j,s}$, L is the set of coefficients α_j calculated for the set of q+1 perfumes products under the hypothesis of a note L for the perfume product of rank q+1; and f(L) is an optional function of weighting of the different coefficients α_j .

6. (Currently Amended) A method for predicting selecting a product adapted to a user on the basis of its smell or taste, using a user profile determined according to any one of claims 1, 2 and 4, to 5, consisting in the method comprising:

estimating a rating for products for which the database eontain <u>includes</u> the scent of <u>or</u> taste prints, by applying the weighting coefficients to the scent or taste prints; and selecting among the products, a subset on the basis of the estimated rating.

7. (Original) The method of claim 6, in which the estimated rating for each product is obtained by applying the following formula:

3

Application No. 10/615,157
Preliminary Amendment mailed February 4, 2005

$$IP_{i} = \sum_{j=1}^{n} \alpha_{j} \cdot MV_{i,j},$$

where IP_i designates the note estimated for the product P_i of the database, where α_j designates the weighting coefficient of rank j affected to the product of rank j of the smell or taste print according to the user's profile, and where $MV_{i,j}$ designates the measurement of rank j of the smell or taste print of product of rank i.

- 8. (Currently Amended) The method of claim 6, in which the product of said subset are selected for having an estimated rating close to the highest or lowest rating with within a predetermined margin, preferably of ten percents.
- 9. (Original) The method of claim 6, in which a predetermined number of products having the highest or lowest estimated rating constitutes said subset.
- 10. (Currently Amended) The method of any one of claims 6 to 9 claim 6, applied to perfumes selection.
- 11. (Currently Amended) The method of any one of claims 6 to 9 claim 6, applied to wines selection.
- 12. (Currently Amended) A system for determining a scent or taste profile of a user comprising:

a database (1) containing smell of or taste prints of products constituted by a set of measurements given by smell or taste electronic sensors;

a memory element for storing for <u>a user rating of</u> each of a set of products chosen among the products contained in said database;

a calculator of weighting coefficients constituting said profile and respectively affected to said sensors, by successive approximation of sets of weighting coefficients leading to minimizing the sum of the quadratic errors over the set of ratings.

4

13. (Currently Amended) A The system for predicting a product adapted to a user on the basis of its smell or taste, using a system according to of claim 12, further comprising:

an estimator to determine estimated ratings for products that have their smell or taste print in the database, by applying the weighting coefficients to the scent or taste prints; and

a selector for selecting among the products, a subset on the basis of the estimated ratings.

- 14. (New) The system of claim 13, wherein said products are perfumes or wines.
- 15. (New) The system of claim 13, wherein said selector is configured to select a the subset of products having estimated ratings within a predetermined margin of the highest or lowest estimated rating.
- 16. (New) The system of claim 12, further comprising a smell or taste electronic sensor.
- 17. (New) The method of claim 1, wherein said satisfaction note rating is a value from 1 to 3.
